Question (Erdős-Volkmann-Ring Problem)

Is there a subring R of $(\mathbb{R}, +, \times, 0, 1)$ such that $\dim_H(R) \neq 0, 1$?

Question

What does this mean?

Descriptive set theory can answer questions about [provability](#).

Fact

Every subset of $\mathbb{R}$ has a Hausdorff dimension.

This dimension can be computed via **prefix-free Kolmogorov K complexity** and **information density**: for $x \in 2^\omega$ define

$$\dim(x) = \liminf_{n \rightarrow \infty} \frac{K(x \upharpoonright_n)}{n}.$$

J. Lutz and N. Lutz proved the following general identification:

Theorem (J. Lutz, N. Lutz (2018))

For every $A \subseteq \mathbb{R}$ we have

$$\dim_H(A) = \min_{B \in 2^\omega} \sup_{x \in A} \dim^B(x).$$

Definition

An uncountable set $A \subseteq \mathbb{R}$ has the **perfect set property** (PSP) if it contains a non-empty perfect subset.

Question

Is there an uncountable set $A \subseteq \mathbb{R}$ which does not contain an uncountable subset?

Definition

An uncountable set $A \subseteq \mathbb{R}$ has the **perfect set property** (PSP) if it contains a non-empty perfect subset.

Question

Is there an uncountable set $A \subseteq \mathbb{R}$ which does not contain an uncountable subset?

Answer

It's complicated.

Axioms	Behaviour
ZF + DC	
ZFC	
ZF + DC + AD	
ZFC + (V=L)	

Axioms	Behaviour
ZF + DC	PSP holds for all Σ_1^1 sets (Souslin)
ZFC	
ZF + DC + AD	
ZFC + (V=L)	

Axioms	Behaviour
ZF + DC	PSP holds for all Σ_1^1 sets (Souslin)
ZFC	PSP fails for some set (Bernstein)
ZF + DC + AD	
ZFC + (V=L)	

Axioms	Behaviour
ZF + DC	PSP holds for all Σ_1^1 sets (Souslin)
ZFC	PSP fails for some set (Bernstein)
ZF + DC + AD	PSP holds for all sets (Mycielski, Swierczkowski)
ZFC + (V=L)	

Axioms	Behaviour
ZF + DC	PSP holds for all Σ_1^1 sets (Souslin)
ZFC	PSP fails for some set (Bernstein)
ZF + DC + AD	PSP holds for all sets (Mycielski, Swierczkowski)
ZFC + (V=L)	PSP fails for some Π_1^1 set (Gödel)

Theorem (P. Erdős, B. Volkmann, 1966)

For every $\alpha \in (0, 1)$ there exists a Borel *subgroup* $G \subseteq (\mathbb{R}, +)$ for which

$$\dim_H(G) = \alpha.$$

This means, G as a subset of $\mathbb{R}$ is a Borel set.

Question

What about *subrings* of $\mathbb{R}$?

Theorem (Edgar-Miller, 2001; Bourgain, 2003)

If $R \subseteq (\mathbb{R}, +, \times, 0, 1)$ is an analytic (i.e. Σ_1^1) *subring* then:

- either $\dim_H(R) = 0$
- or $R = \mathbb{R}$.

This means, R as a subset of $\mathbb{R}$ is an analytic set.

Theorem (R. D. Mauldin, 2016 (R. O. Davies, 1984))

(CH) For every $\alpha \in (0, 1)$ there exists a *subring* $R \subseteq (\mathbb{R}, +, \times, 0, 1)$ such that

$$\dim_H(R) = \alpha.$$

In fact, R is a subfield. It *cannot* be Σ_1^1 .

Mauldin comments: $V=L$ implies the subring can be made Σ_2^1 .

Question

What is the descriptive complexity of such a subring?
Assuming $V=L$, *can it be* Π_1^1 ?

Fact

If $A \subseteq \mathbb{R}$ satisfies $\dim_H(A) = \alpha$ then there exists a G_δ set $D \subseteq \mathbb{R}$

$$\dim_H(D) = \alpha \quad \text{and} \quad A \subseteq D.$$

Fact

If $A \subseteq \mathbb{R}$ satisfies $\dim_H(A) = \alpha$ then there exists a G_δ set $D \subseteq \mathbb{R}$

$$\dim_H(D) = \alpha \quad \text{and} \quad A \subseteq D.$$

Fact

If $A \subseteq \mathbb{R}$ satisfies $\dim_H(A) = \alpha$ then there exists a G_δ set $D \subseteq \mathbb{R}$

$$\dim_H(D) = \alpha \quad \text{and} \quad A \subseteq D.$$

Fact

If A is not contained in any G_δ set of Hausdorff dimension less than α , then $\dim_H(A) \geq \alpha$.

Generalising an idea of Erdős, K. Kunen, and Mauldin (1981), and A. Miller (1989):

Theorem (Z. Vidnyánszky, 2014)

($V=L$) Let $P \subseteq 2^\omega$ be uncountable Borel. If $F \subseteq \mathbb{R}^\omega \times 2^\omega \times \mathbb{R}$ is $\mathfrak{N}_1^1$ and for every $(A, p) \in \mathbb{R}^\omega \times 2^\omega$, the section $F_{(A,p)}$ is cofinal in $\leq_T$, then there exists a $\mathfrak{N}_1^1$ set $R \subseteq \mathbb{R}$ such that

$$P = \{p_\beta \mid \beta < \omega_1\} \quad \text{and} \quad R = \{x_\beta \mid \beta < \omega_1\} \quad \text{and} \quad x_\beta \in F_{(R \upharpoonright_\beta, p_\beta)}.$$

Generalising an idea of Erdős, K. Kunen, and Mauldin (1981), and A. Miller (1989):

Theorem (Z. Vidnyánszky, 2014)

*($V=L$) Let $P \subseteq 2^\omega$ be **uncountable Borel**. If $F \subseteq \mathbb{R}^\omega \times 2^\omega \times \mathbb{R}$ is $\mathfrak{N}_1^1$ and for every $(A, p) \in \mathbb{R}^\omega \times 2^\omega$, the section $F_{(A,p)}$ is cofinal in $\leq_T$, then there exists a $\mathfrak{N}_1^1$ set $R \subseteq \mathbb{R}$ such that*

$$P = \{p_\beta \mid \beta < \omega_1\} \quad \text{and} \quad R = \{x_\beta \mid \beta < \omega_1\} \quad \text{and} \quad x_\beta \in F_{(R \upharpoonright_\beta, p_\beta)}.$$

ω_1

Theorem (R.)

For $\alpha \in (0, 1)$, the set

$$\{c \mid c \text{ is a } G_\delta \text{ Borel code for } A \text{ and } \dim_H(A) \geq \alpha\}$$

is Σ_1^1 -complete.

Corollary

For $\alpha \in (0, 1)$, the set

$$\{c \mid c \text{ is a } G_\delta \text{ Borel code for } A \text{ and } \dim_H(A) < \alpha\}$$

is Π_1^1 -complete.

Proof (hardness)

Reduce a tree T on ω to a suitable Borel code. The idea:

- A path $x \in [T]$ yields an infinite sequence of nested intervals:

$$\langle 1, 2, 3, \dots \rangle \mapsto \langle (0.1, 0.2), (0.12, 0.13), (0.123, 0.124), \dots \rangle$$

Proof (hardness)

Reduce a tree T on ω to a suitable Borel code. The idea:

$$\langle 1, 2, 3, \dots \rangle \mapsto \langle (0.1, 0.2), (0.12, 0.13), (0.123, 0.124), \dots \rangle$$

- These can be placed on **distinct levels** in the Borel code:

Proposition (R.)

Fix $\alpha \in (0, 1)$. Any infinite path $x \in [T]$ codes a G_δ set $A_x \subset \mathbb{R}$ such that $\dim_H(A_x) \geq \alpha$.

Proposition (R.)

Fix $\alpha \in (0, 1)$. Any infinite path $x \in [T]$ codes a G_δ set $A_x \subset \mathbb{R}$ such that $\dim_H(A_x) \geq \alpha$.

Proposition (R.)

Fix $\alpha \in (0, 1)$. Any infinite path $x \in [T]$ codes a G_δ set $A_x \subset \mathbb{R}$ such that $\dim_H(A_x) \geq \alpha$.

Proof (membership)

Definition

$B \in 2^\omega$ is a **Hausdorff oracle** for $A \subseteq \mathbb{R}$ if

$$\dim_H(A) = \sup_{x \in A} \dim^B(x).$$

Let A be G_δ . Using the **point-to-set principle**,

$$\dim_H(A) \geq \alpha \iff (\forall n < \omega)(\exists x \in A) \left(\dim^B(x) > \alpha - 2^{-n} \right)$$

where B is a Hausdorff oracle for A .

Fact

If $A \subseteq \mathbb{R}$ is analytic and satisfies $\dim_H(A) = \alpha$ then for ever $\beta < \alpha$ there exists a compact set $K_\beta \subseteq A$ such that

$$\dim_H(K_\beta) = \beta .$$

Every compact set K is effectively compact **relative to some oracle B** ; then, B is a Hausdorff oracle for K (J. Hitchcock, J. Lutz; D. Stull). Thus,

$$\dim_H(A) \geq \alpha \iff (\forall n < \omega)(\exists K \text{ compact})(\exists B)(\exists x \in K) \\ \left(K \subseteq A \wedge B \text{ is Hausdorff for } K \wedge \dim^B(x) > \alpha - 2^{-n} \right) .$$

Proposition (R.)

This clause is Σ_1^1 in the Borel code of A .

What about a “direct” construction?

- What are the conditions?

By the previous theorem, the set of all sufficiently simple G_δ sets is Π_1^1 complete, hence not Borel, hence too complicated.

- Can one build R real by real, by the point-to-set principle?

This is difficult to apply since we must close under $+$ and $\times$. And since $\mathbb{Q} \subset R$, we cannot make use of compactness.

- Even then, we add countably many reals at every step.

For every x we enumerate into our subring, we must close under all ring-theoretic operations, which yields (under CH) countably many reals to add. A Π_1^1 basis B gives a Σ_2^1 subring R :

$$x \in R \iff (\exists y \in B)(x \text{ is generated by } y).$$

Question

Is there a subring $R \subseteq (\mathbb{R}, +, \times, 0, 1)$ with $\dim_H(R) \neq 0, 1$?

Edgar-Miller, Bourgain

Mauldin

[We] state these results in terms of Borel sets because that is how much we can prove in ZFC, but they are not really about Borel sets. All of this holds for all constructible sets in $L(\mathbb{R})$ if one assumes the large-cardinal hypothesis and for all sets if one assumes [...] AD and forgets about the axiom of choice.

*A. Montalbán on Martin's conjecture
NAMS 66(8), 2019*
